

Antibodies against Nipah Virus in Bats

Why in News

A recent survey has found the **presence of** antibodies against the **Nipah virus (NiV)** in some **bat species** from a cave in **Mahabaleshwar**, a popular hill station in **Maharashtra**.

■ The survey was conducted by the <u>Indian Council of Medical Research (ICMR)</u> - **National Institute** of Virology (NIV).

Key Points

- About the Survey:
 - The NIV team looked at Rousettus leschenaultii and Pipistrellus pipistrellus bats that are common in India.
 - Pteropus medius bats, which are large fruit-eating bats, are the reservoir for NiV in India as both NiV RNA and antibodies were detected in the samples of these bats collected during previous NiV outbreaks.
 - A bat's immune system is especially adept at withstanding viral infection because of its ability to limit excessive inflammation — which uniquely allows viruses to thrive without proving deadly to the mammal.
- Nipah virus (NiV):
 - About:
 - It is a zoonotic virus (it is transmitted from animals to humans).
 - The organism which causes Nipah Virus encephalitis is an RNA or Ribonucleic acid virus of the family Paramyxoviridae, genus Henipavirus, and is closely related to Hendra virus.
 - Hendra virus (HeV) infection is a rare emerging zoonosis that causes severe and often fatal disease in both infected horses and humans.
 - It first broke out in Malaysia and Singapore in 1998 and 1999.
 - It first appeared in domestic pigs and has been found among several species of domestic animals including dogs, cats, goats, horses and sheep.
 - Transmission:
 - The disease **spreads through** <u>fruit bats</u> **or 'flying foxes,' of the genus Pteropus,** who are natural reservoir hosts of the Nipah and Hendra viruses.
 - The virus is present in bat urine and potentially, bat faeces, saliva, and birthing fluids.
 - Symptoms:
 - The human infection presents as an <u>encephalitic syndrome</u> marked by fever, headache, drowsiness, disorientation, mental confusion, coma, and potentially death.

Prevention:

• Currently, there are **no vaccines** for both humans and animals. Intensive supportive care is given to humans infected by Nipah virus.

FIRST NIPAH DETECTION IN MAHARASHTRA Nipah Virus (NiV) is on the

top 10 pathogen list of WHO First identified in Malaysia in 1998-99 during

an encephalitis-like outbreak among pigs and pig handlers, with a case fatality rate (CFR) of 40%

Researchers test bats in Kozhikode in 2018

NIPAH IN INDIA

India has experienced four NiV outbreaks, with CFR ranging from 65 to 100%

2001 in Siliguri district, West Bengal 2007 in Nadia district in West Bengal

2018 in Kozhikode district in Kerala

with 18 deaths 2019 in Kozhikode

The Disease

- Infected bats shed the virus in excretion & it can jump to humans
- > NiV can be fatal, causing swelling of brain (encephalitis) after signs of respiratory illness

MAHABALESHWAR FINDINGS

- Large fruit-eating Pteropus medius bats said to be NiV reservoir in India
- ➤ 65 Rousettus leschenaultii (medium fruit-eating) bats and 15 (tiny, insectivorous) Pipistrellus pipistrellus
- from a Mahabaleshwar cave tested in 2020
- > Antibodies found in 33 leschenaultii and one Pipistrellus bat
- First report of possible NiV infection in R leschenaultii bats in India
