

Ozone Levels Breached Safe Limit | Haryana | 18 May 2024

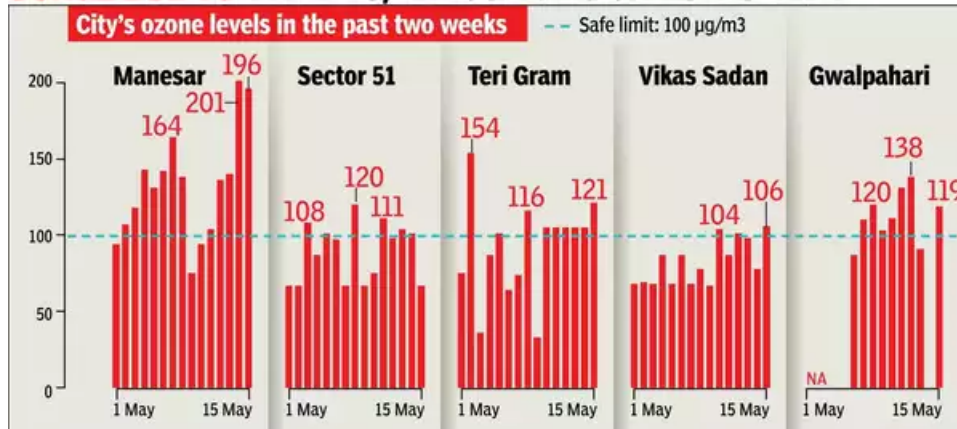

Why in News?

According to **the Haryana State Pollution Control Board (HSPCB)**, the ground-level [ozone level](#) has exceeded safe limits in certain areas of the city over the past 15 days.

Key Points

- Data from **air monitoring stations in Manesar, Sector 51, and Gwalpahari** indicate multiple instances of surpassing the 100 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) eight-hour ozone limit.
- Experts have characterized the situation as concerning, noting that the existence of ground-level ozone indicates increased levels of other pollutants such as [nitrogen oxide \(NO_x\)](#) and **sulphur oxide (So_x)**.
- These pollutants interact with sunlight to produce ozone, with this phenomenon predominantly happening during the day in locations experiencing traffic congestion or where multiple industries are active.
- **Tropospheric ozone** exposure poses health risks and can worsen conditions like **asthma and chronic obstructive pulmonary disease**.
- Officials from HSPCB stated that they have instructed local authorities to take steps to **reduce road dust and burning of garbage**.

// SURGE DUE TO TRAFFIC, INDUSTRIES & RISING TEMP

Ozone

- **Ozone (composed of three atoms of oxygen)** is a gas that occurs both in the Earth's upper atmosphere and at ground level.
- Ozone can be **"good" or "bad" for people's health and the environment**, depending on its location in the atmosphere.
