

Mining Threatens African Great Apes

Source: DTE

A recent study published in the journal Science Advances has highlighted the grave threat posed by **mining** to the **great ape population in Africa.**

- The study indicates that more than a third of the entire great ape population in Africa, nearly 180,000 individuals, faces direct or indirect threats from mining activities.
- Approximately 20% of critical habitats intersect with mining areas. Countries such as Liberia, Sierra Leone, Mali, and Guinea show significant overlaps between great ape habitats and mining sites.
- Bonobo (Pan paniscus); Chimpanzee (Pan troglodytes); Eastern Gorilla (Gorilla beringei); Western Gorilla (Gorilla gorilla), and orangutans (Pongo) are referred to as great apes due to their large size and humanlike features. Great apes are a taxonomic family of primates classified as Hominidae.
- According to the <u>IUCN Red List</u>, all great ape species are listed as <u>Endangered</u> or <u>Critically</u> <u>Endangered</u>.
