

Mercury Pollution

For Prelims: Minamata Convention on Mercury, Mercury and its characteristics.

For Mains: Concerns related to Mercury Pollution, Environmental Pollution & Degradation.

Why in News?

Recently, Indonesia has **introduced a global declaration** that calls on parties to the **Minamata Convention on Mercury** to tackle illegal trade of mercury.

- The declaration was read in Nusa Dua, Bali, where Indonesia is hosting the fourth Conference of Parties (COP4) to the Minamata Convention on Mercury.
- The conference is being held from 21st to 25th March 2022.

What are the Objectives of the Declaration?

The non-binding declaration calls upon parties to:

- Develop practical tools and notification and information-sharing systems for monitoring and managing trade in mercury.
- **Exchange experiences and practices relating to combating illegal trade** in mercury, including reducing the use of mercury in artisanal and small-scale gold mining.
- Share examples of national legislation and data and information related to such trade.

What is the Minamata Convention on Mercury?

- The Minamata Convention on Mercury is a global treaty to protect human health and the environment from the adverse effects of mercury and its compounds.
- It was agreed at the fifth session of the Intergovernmental Negotiating Committee in Geneva, Switzerland 2013.
- Controlling the anthropogenic releases of mercury throughout its lifecycle is one of the key obligations under the Convention.
- The Convention also addresses interim storage of mercury and its disposal once it becomes waste, sites contaminated by mercury as well as health issues.
- The Convention covers all aspects of the life cycle of mercury, controlling and reducing mercury across a range of products, processes and industries. This includes controls on:
 - mercury mining
 - the manufacture and trade of mercury and products containing mercury
 - disposal of mercury waste
 - emissions of mercury from industrial facilities.
- Countries that have ratified the Convention are bound by international law to put these controls in place.
 - India has ratified the Convention.

What do we know about Mercury?

About:

- Mercury is a **naturally occurring element** that is found in air, water and soil.
- Exposure to mercury even small amounts may cause serious health problems, and is a threat to the development of the child in utero and early in life.
- Mercury may have toxic effects on the nervous, digestive and immune systems, and on lungs, kidneys, skin and eyes.
- Mercury is considered by the <u>World Health Organisation (WHO)</u> as one of the top ten chemicals or groups of chemicals of major public health concern.
- People are mainly exposed to **methylmercury**, (an organic compound) when they eat fish and shellfish and are more vulnerable to Minamata disease.
 - **Minamata Disease:** A disorder **caused by methylmercury poisoning** that was first described in the inhabitants of Minamata Bay, Japan and resulted from their eating fish contaminated with mercury industrial waste.
 - The **disease** is **characterized** by **peripheral sensory loss**, tremors, and both hearing and visual loss.
 - Methylmercury is **very different from ethylmercury**. Ethylmercury is used as a preservative in some vaccines and does not pose a health risk.

Types of Sources:

- Natural sources: Volcanic eruptions and emissions from the ocean.
- Anthropogenic (human-caused) emissions: It includes mercury that is released from fuels or raw materials, or from uses in products or industrial processes.
 - Globally, **Artisanal and Small-Scale Gold Mining (ASGM)**: It is the largest source of anthropogenic mercury emissions (37.7%), followed by stationary combustion of coal (21%).
 - Other **large sources of emissions** are non-ferrous metals production (15%) and cement production (11%).
 - Globally, 10-20 million people work in the ASGM sector and many of them use mercury on a daily basis.

UPSC Civil Services Examination, Previous Year Questions (PYQs)

- Q. Indiscriminate disposal of used fluorescent electric lamps causes mercury pollution in the environment. Why is mercury used in the manufacture of these lamps? (2010)
- (a) A mercury coating on the inside of the lamp makes the light bright white
- (b) When the lamp is switched on, the mercury in the lamp causes the emission of ultra-violet radiations
- (c) When the lamp is switched on, it is the mercury which converts the ultra-violet energy into visible light
- (d) None of the statement given above is correct about the use of mercury in the manufacture of fluorescent lamps

Ans: (b)
