

## Emergency Alert System

**For Prelims:** Emergency Alert Systems in India, [Cyclones](#), [Floods](#), [Landslides](#), [Earthquakes](#)

**For Mains:** Challenges faced by India's emergency alert systems, Disaster and Disaster Management.

[Source: TH](#)

### Why in News?

A recent [earthquake of 6.4 magnitude hit Nepal on 3rd November 2023](#), followed by an aftershock, which has exposed significant shortcomings in emergency alert systems in and around Delhi.

- As tremors rattled the region, both government and private alert mechanisms failed to reach a considerable number of people who experienced palpable shaking
- Emergency alert systems are mechanisms that provide early warning and notification of impending or ongoing disasters, such as earthquakes, [cyclones](#), [floods](#), [landslides](#), etc.

### What are the Emergency Alert Systems in India?

- **Google's Android Earthquake Early Warning System:**
  - This is a feature that uses the sensors in Android smartphones to **detect seismic activity and alert users** about potential earthquakes.
    - It also collects and shares the data with seismological agencies to improve earthquake detection and analysis.
  - Google launched this feature in India in September 2023, in collaboration with the [National Disaster Management Authority \(NDMA\)](#) and the **National Centre for Seismology (NCS)**, Ministry of Earth Sciences.
  - Google's alerts are triggered based on the **Modified Mercalli Intensity (MMI)** Scale, an alternative to the Richter scale.
    - The MMI scale measures the **effects of an earthquake at a specific location**. It describes the observed effects of an earthquake, including what **people experience and what happens to buildings and objects**.
      - **The MMI scale is different from the Richter scale and has a range of 1 to 12.**
- **Cell Broadcast Alert System (CBAS):**
  - The [CBAS](#) represents cutting-edge technology that empowers us to **disseminate critical and time-sensitive disaster management messages** to all mobile devices within specified geographical areas, regardless of whether the recipients are residents or visitors.
  - Common applications of Cell Broadcast include delivering emergency alerts such as severe weather warnings (e.g., **Tsunamis, Flash Floods, Earthquakes**), public safety messages, evacuation notices, and other critical information.
  - It is developed in collaboration with the [Department of Telecommunications \(DOT\)](#) and the **NDMA** and other agencies to generate and disseminate the alerts.
- **Ministry of Earth Science's National Centre for Seismology (NCS):**

- This is the agency responsible for monitoring and reporting the seismic activity in India and its neighbourhood.
- It operates a network of seismological observatories across the country, and provides real-time data and information on earthquakes and tsunamis.
- It also maintains a website and a mobile app, called **BhooKamp**, to provide earthquake alerts and updates to the public.

## What are the Gaps and Challenges in the Emergency Alert Systems?

### ▪ Lack of Coordination and Integration:

- India lacks a **single, standardized emergency alert system**, resulting in inconsistent and unreliable information for both the public and authorities.
  - Multiple agencies and platforms operate independently, causing confusion, duplication, and delays in alert generation and dissemination.
- During recent tremors around Delhi, the NCS website and app crashed, facing a **sudden surge in traffic when real-time information on the tremors** was crucial.
  - This incident highlights significant coordination challenges in managing emergency situations.

### ▪ Lack of Accuracy and Timeliness:

- The emergency alert systems in India are not able to provide **accurate and timely information** on the location, magnitude, intensity, and impact of the disasters.
  - This is due to the **limitations in the data collection**, analysis, and transmission.

### ▪ Lack of Awareness and Preparedness:

- The emergency alert systems in India are not able to reach and inform the masses effectively, due to the **lack of awareness and preparedness** among the public and the authorities.
  - Many people do not know how to access, interpret, and respond to the alerts, and often ignore or dismiss them as false alarms.
- There is also a lack of **public education and awareness campaigns** on the disaster risks and mitigation measures and the response mechanisms.

## Way Forward

- Develop a unified emergency alert system incorporating multiple channels like SMS, voice calls, social media, and traditional mediums.
  - **Establish seamless coordination and integration with key agencies like MoES, DoT, NDMA, IMD, and NCS.**
- Leverage advanced technologies such as satellites, and **Artificial Intelligence** to enhance data collection, analysis, and transmission.
- Strengthen the infrastructure by expanding seismological observatories, deploying additional sensors, and upgrading computing capabilities.
  - Aim for **near-instantaneous alert issuance**, providing **granular details on disaster location, magnitude, and impact.**
- Inform and engage the public on disaster risks, mitigation measures, and the functionality of emergency alert systems.
- Conduct **frequent drills involving stakeholders and communities** to test and refine alert systems and response mechanisms.

## UPSC Civil Services Examination Previous Year Question (PYQ)

**Q. Discuss the recent measures initiated in disaster management by the Government of India departing from the earlier reactive approach. (2020)**
