

Black-Browed Babbler Rediscovered

Why in News

Recently, a **Black-Browed Babbler** (*Malacocincla perspicillata*) was **rediscovered** in southeastern Kalimantan, the part of **Borneo** that is administered by **Indonesia**.

Key Points

History:

- In the 1840s, a mystery bird was caught on an expedition to the East Indies. It was named as black-browed babbler.
- The species was never seen in the wild again, and a stuffed specimen featuring a bright yellow glass eye was the only proof of its existence.
 - No Asian bird has been missing for as long as Indonesia's Black-browed Babbler. It has been missing for the last 170 years.
 - This bird is often called 'the biggest enigma in Indonesian ornithology'.

About:

- It has a strong bill, chocolate colouring and distinctive black eye-stripe, its iris is of striking maroon colour.
- It has **brown wings** and a **black stripe** across its brow.
- Significance:
 - Discoveries like this give hope that it's possible to find other species that have been lost to science for decades or longer.
 - The Vision • More than 150 species of birds around the world are considered "lost" with no confirmed sightings in the past decade.
- Protection Status:
 - IUCN Red List: Data Deficient
