

Black Redstart

- It is a small-sized bird (14-15 cms) and it breeds across the Himalayan Range.
- It occurs almost throughout Europe, Asia and in the portions of Africa and breed in the high altitude areas of Kashmir, Ladakh, Tibet and the Central Himalayan Range.
 - In India, the bird sticks to areas near wetlands, open cultivation, scrubs, gardens and orchards.
- The bird has two races: //

- **P. phoenicuroides** (in Western Himalayas)
- P. Rufiventris (in Central and Eastern Himalayas)
- The **primary difference** between them is that the male of the former has a grey crown, nape and lower back while the latter ones are much darker.
- Both sexes display a bright rufous-orange tail which is best seen when they fly or flash it open while shivering their tails, justifying the name Redstart (steort means 'tail' in proto-Germanic language).
- IUCN Red List status- Least Concerned.
- It is protected under the Schedule IV of the <u>Wildlife (Protection) Act, 1972.</u>
