

Enriched Uranium Stockpile by Iran

Why in News

Recently, Iran's atomic agency said that **its stockpile of 20% enriched uranium** has reached over 210 kilograms.

- In April 2021, the <u>International Atomic Energy Agency</u> (IAEA) said Iran had begun the process of enriching uranium to 60% fissile purity at an above-ground nuclear plant at Natanz.
- Under the historic 2015 nuclear deal between Iran and the World Powers, Iran was not meant to enrich uranium above 3.67%. Enriched uranium above 90% can be used for nuclear weapons.

Key Points

- Uranium Enrichment:
 - Natural uranium consists of two different isotopes nearly 99% U-238 and only around 0.7% of U-235.
 - U-235 is a fissile material that can sustain a chain reaction in a nuclear reactor.
 - **Enrichment process increases the proportion of U-235** through the process of isotope separation (U-238 is separated from U-235).
 - For nuclear weapons, enrichment is required upto 90% or more which is known as weapons-grade uranium.
 - Low-enriched uranium, which typically has a 3-5% concentration of U-235, can be used to produce fuel for commercial nuclear power plants.
 - Highly enriched uranium has a purity of 20% or more and is used in research reactors.

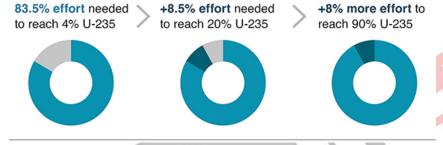

Uranium enrichment process

Increasing the concentration of **U-235** atoms, by removing **U-238**, means it can be used for nuclear fuel or bombs

Natural uranium contains 0.7% U-235	Low-enriched fuel for commercial nuclear power plants 5% U-235	High-enriched fuel for nuclear research reactors 20% U-235	Weapons-grade 90% U-235
	Iran is limited to 3.67% U-235 under	2015 nuclear deal	

How much effort is required to get to weapons-grade uranium?

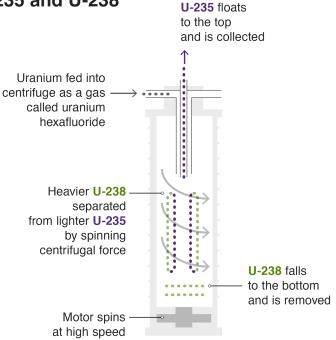

Very little extra effort is needed to get from 20% enriched uranium to bomb material

- The tricky process of enrichment becomes far easier and requires fewer centrifuges as it moves into the higher purities.
- In other words, getting to 90% purity is much easier starting from 20%, and easier still starting from 60%.

How a centrifuge separates uranium atoms, U-235 and U-238

2015 Nuclear Deal:

- In 2015, Iran with the P5+1 group of world powers the USA, UK, France, China, Russia, and Germany agreed on a long-term deal on its nuclear programme.
 - The deal was named as **Joint Comprehensive Plan of Action (JCPOA)** and in common parlance as Iran Nuclear Deal.
 - Under the deal, Iran agreed to curb its nuclear activity in return for the lifting
 of sanctions and access to global trade.
 - The agreement allowed Iran to accumulate small amounts of uranium for research but it banned the enrichment of uranium, which is used to make reactor fuel and nuclear weapons.
 - Iran was also required to redesign a heavy-water reactor being built, whose spent fuel would contain plutonium suitable for a bomb and to allow international inspections.
- In May 2018, the USA abandoned the deal criticising it as flawed and reinstated and tightened its sanctions.
 - Since sanctions were tightened, Iran has been steadily breaking some of its commitments to pressure the remaining signatories to find a way to provide sanctions relief.
- After months of delays, the <u>European Union</u>, Iran and the US have recently announced that indirect talks to resuscitate the deal would resume on 29th November 2021 in Vienna.
