

WHO Prequalification to R21/Matrix-M Vaccine

Source: TH

Why in News?

In a significant development in the global fight against <u>malaria</u>, the <u>World Health Organization (WHO)</u> has recently added the <u>R21/Matrix-M malaria vaccine</u> to its list of prequalified vaccines.

- Developed by Oxford University and manufactured by the Serum Institute of India, this vaccine holds promise in preventing malaria in children.
- The R21/Matrix-M vaccine became the **second malaria vaccine to achieve WHO prequalification**, the first one was the RTS, S/AS01 vaccine.

What is the Significance of WHO Prequalification?

- WHO prequalification of the R21 vaccine serves as a robust assurance of the safety and efficacy
 of the vaccine.
 - Products that achieve WHO prequalification gain credibility and are more readily accepted in international markets, as WHO applies rigorous international standards to evaluate their safety, effectiveness, and manufacturing compliance.
- WHO prequalification is often a prerequisite for procurement by international organizations, such as the <u>United Nations Children's Fund (UNICEF)</u>.
 - It enhances the likelihood of a vaccine being included in **global immunization programs,** ensuring a wider reach.
- WHO prequalification is instrumental in securing **Gavi support**, enabling the implementation of vaccination programs in regions with limited resources.
 - Gavi, the Vaccine Alliance, created in 2000 provides funding support for the deployment of vaccines in developing countries.

What is Malaria?

About:

- It is a life-threatening mosquito-borne blood disease caused by Plasmodium parasites. It is preventable and curable.
 - Predominantly found in tropical and subtropical regions of Africa, South America, and Asia.
- Malaria spreads through infected female Anopheles mosquito bites, with parasites multiplying in the liver and subsequently attacking Red Blood Cells.
 - Among the five parasite species causing malaria, **Plasmodium falciparum and Plasmodium vivax** present the highest threat to human health.
- Symptoms of malaria include **fever and flu-like illness,** including shaking chills, headache, muscle aches, and tiredness.

Malaria Burden:

- Malaria places a particularly high burden on **children in the African region**, where nearly half a million children die from the disease each year.
- In 2022, there were an estimated 249 million malaria cases in the world and 6,08,00 malaria deaths across 85 countries.

- Initiatives to Curb Malaria:
 - Global:
 - E-2025 initiative.
 - Global Technical Strategy for Malaria 2016-2030.
 - o India:
 - National Framework for Malaria Elimination (NFME).
 - National Strategic Plan for Malaria Elimination (2017-22).
 - The Indian Council of Medical Research (ICMR)'s Malaria Elimination Research Alliance-India (MERA-India)

UPSC Civil Services Examination, Previous Year Questions (PYQs)

Prelims

- Q. Widespread resistance of malarial parasite to drugs like chloroquine has prompted attempts to develop a malarial vaccine to combat malaria. Why is it difficult to develop an effective malaria vaccine? (2010)
- (a) Malaria is caused by several species of Plasmodium
- (b) Man does not develop immunity to malaria during natural infection
- (c) Vaccines can be developed only against bacteria
- (d) Man is only an intermediate host and not the definitive host

Ans: (b)
