

# **GPT-40**

#### Source: IE

#### Why in News?

Recently, **OpenAI** introduced its latest <u>large language model (LLM)</u> called **GPT-40**, billing it as their fastest and most powerful AI model so far.

## What are the Key Highlights About GPT-4o?

- About: GPT-40 ("o" stands for "Omni" here) is a revolutionary AI model developed by OpenAI to enhance human-computer interactions.
  - It allows users to input any combination of text, audio, and image and receive responses in the same formats, making it a multimodal AI model.
- Technology Applied: LLMs are the backbone of GPT-40. Large amounts of data are fed into these
  models to make them capable of learning things themselves.
  - GPT-40 differs from its predecessors by using a single model to handle text, vision, and audio tasks, eliminating the need for multiple models.
    - For example, previous models required separate models for transcription, intelligence, and text-to-speech in voice mode, but GPT-40 integrates all of these capabilities into a single model.
  - It can process and understand inputs more holistically, including tone, background noises, and emotional context in audio inputs.
  - GPT-40 excels in areas like **speed and efficiency**, responding to queries as fast as a human does in conversation, in around 232 to 320 milliseconds.
- Key Features and Abilities:
  - Enhanced audio and vision understanding allow GPT-4o to process tone, background noises, and emotional context, and identify objects.
  - GPT-4o demonstrates significant advancements in handling non-English text, catering to a global audience.
- Safety Concerns:
  - Despite its advancements, GPT-40 is still in the early stages of exploring unified multimodal interaction, with ongoing development required.
  - OpenAl emphasises built-in safety measures and continuous efforts to address risks like cybersecurity, misinformation, and bias.

#### Large Language Model (LLM)

- A LLM is an AI program capable of recognising and generating text. LLMs are trained on vast datasets using <u>machine learning</u> and <u>deep learning</u>, particularly transformer models that mimic the human brain's neural structure.
- LLMs typically rely on transformer models, consisting of an encoder and a decoder. LLMs can be categorised based on architecture, training data, size, and availability.
- LLMs are used for generative AI tasks like producing text, assisting programmers with coding, and various applications like sentiment analysis and <u>chatbots</u>.
- They excel at understanding natural language and processing complex data, but can also provide unreliable information or "hallucinate" responses if given **poor input data, and pose security**

### **UPSC Civil Services Examination, Previous Year Questions (PYQs)**

#### <u>Prelims</u>

# Q. With the present state of development, Artificial Intelligence can effectively do which of the following? (2020)

- 1. Bring down electricity consumption in industrial units
- 2. Create meaningful short stories and songs
- 3. Disease diagnosis
- 4. Text-to-Speech Conversion
- 5. Wireless transmission of electrical energy

#### Select the correct answer using the code given below:

- (a) 1, 2, 3 and 5 only
  (b) 1, 3 and 4 only
  (c) 2, 4 and 5 only
- (d) 1, 2, 3, 4 and 5

Ans: (b)
