

Kala Azar

Source: IE

Why in News?

India achieved significant progress in eliminating <u>Kala Azar (KA)</u>, reporting **less than one case per 10,000 population in 2023**, compared to previous years.

 Data from the <u>National Vector Borne Disease Control Programme</u> revealed a decline in Kala Azar cases, with 595 cases and four deaths reported in 2023 compared to 891 cases and three deaths in 2022.

Note:

- India has not yet eliminated KA but has made substantial progress towards its elimination goal.
 - India's initial target year for Kala Azar elimination was 2010, which was later extended to 2015, 2017, and then 2020.
- The <u>WHO</u> defines elimination for KA as having **fewer than one case per 10,000 people at the sub-district (block Primary Health Centres) level** in India. Once achieved, the elimination is to be sustained for 3 years for KA elimination certification.
 - India will need to sustain this momentum over the next three years to receive WHO
 certification, considering that India has missed at least four deadlines for Kala Azar
 elimination.
- In Oct 2023, **Bangladesh became the first country, globally**, to be officially validated by the WHO for eliminating Kala Azar as a public health problem.

What are the Key Facts About Kala Azar?

About:

 Kala-azar (visceral leishmaniasis), also known as Black Fever is a fatal disease caused by a protozoan parasite Leishmania donovani.

Symptoms:

• It is characterised by irregular bouts of fever, weight loss, enlargement of the spleen and liver, and anaemia.

Prevalence:

 Most cases occur in Brazil, east Africa and India. An estimated 50,000 to 90 000 new cases of VL occur worldwide annually, with only 25-45% reported to WHO. It has an outbreak and mortality potential.

Transmission:

 Leishmania parasites spread through bites of infected female sandflies, feeding on blood for egg production. Over 70 animal species, including humans, can carry these parasites.

Major Risk Factors:

Poverty, poor housing, and sanitation.

- Diets lacking essential nutrients.
- Movement into high-transmission areas.
- Urbanisation, deforestation, climate change.

Diagnosis and Treatment:

- Suspected visceral leishmaniasis cases require immediate medical attention. Diagnosis involves clinical signs combined with parasitological or serological tests.
 - Left untreated, it can be fatal in 95% of cases.

Prevention and Control:

- **Early diagnosis and prompt treatment** are crucial in reducing disease prevalence, and preventing disabilities, and death.
- **Vector control, such as insecticide spray** and the use of insecticide-treated nets, helps reduce transmission by decreasing the number of sandflies.
- **Effective disease surveillance** is important for monitoring and acting during epidemics and high case fatality rates.
- **Social mobilization and strengthening partnerships,** including community education and collaboration with stakeholders, are critical for effective control.

India's Efforts to Control Kala Azar:

- The Government of India launched a centrally sponsored Kala-azar control program in 1990-91, which was later revised in 2015.
 - The program aimed to eliminate Kala-azar by 2023, aligning with the WHO neglected tropical diseases (NTDs) Roadmap goal of 2030.
- The National Vector Borne Disease Control Programme (NVBDCP), 2003 is an umbrella programme for prevention and control of vector borne diseases viz., malaria, lymphatic filariasis, kala azar, and chikungunya.

Recent Efforts:

- Rigorous indoor residual spraying effort aimed at curtailing sandfly breeding sites; application of a special soil to seal crevices in mud walls, preventing sandflies from nesting.
- Pucca houses in KA-affected villages have been constructed under PMAY-G A total of 25,955 houses in 2017-18 (1371 houses in Bihar & 24584 in Jharkhand).
- Mobilisation of the <u>ASHA (Accredited Social Health Activist) network</u> to
 ensure completion of treatment for PKDL patients, who require a 12-week course of
 Miltefosine (an antileishmanial agent).

Post-kala-azar Dermal Leishmaniasis (PKDL)

- PKDL is a skin condition that follows visceral leishmaniasis, causing rashes on the face, arms, and trunk.
- It affects mainly Sudan and the Indian subcontinent, with 5-10% of kala-azar patients developing it.
- PKDL may occur 6 months to a year after kala-azar treatment, potentially spreading Leishmania.

UPSC Civil Services Examination, Previous Year Questions (PYQs)

Prelims:

Q. Consider the following diseases: (2014)

- 1. Diphtheria
- 2. Chickenpox
- 3. Smallpox

Which of the above diseases has/have been eradicated in India?

- (a) 1 and 2 only
- **(b)** 3 only

(c) 1, 2 and 3 (d) None

Ans: (b)
