

Next-Gen Sodium Batteries

Source: IND

Recently, scientists from South Korea have developed next-generation **sodium batteries capable of charging in just a few seconds.**

- These new hybrid sodium-ion batteries combine materials from traditional batteries with those used in <u>supercapacitors</u>.
 - These are **both cheaper and safer than the conventional**<u>lithium-ion batteries</u> found in smartphones and electric cars.
- Sodium (Na) is also 500 times more abundant than lithium, while holds the potential for greater charge and efficiency than its Li-ion batteries.
- Sodium-ion batteries haven't been widely adopted due to drawbacks like slow charging and low energy storage.
- This new battery offers:
 - Faster charging times than current lithium-ion batteries.
 - Higher energy density than commercial lithium-ion batteries (247 Wh/kg).
 - High power density (34,748 W/kg).
- Its potential applications include <u>electric vehicles</u> and consumer electronics.
