

Bathynomus raksasa: Isopod Species

Why in News

Recently, scientists have reported the discovery of the first super giant isopod species in the eastern Indian Ocean named 'Bathynomus raksasa'.

- It has been described as the 'cockroach of the sea'.
- A team of researchers from Singapore discovered it while exploring waters of the Indian Ocean in Bantan, off the southern coast of West Java in Indonesia in 2018.

The Vision

Key Points_//

- Super Giant Isopod: The Bathynomus raksasa is a super giant isopod in the genus Bathynomus.
 - Isopods are **marine invertebrates** (animals without backbones) that belong to the greater crustacean group of animals, which also includes crabs and shrimp.
 - They live in many different types of habitat, from mountains and deserts to the deep sea.
 - **Isopods that reach 50 cm are referred to as supergiants.** The largest isopod species are from the genus Bathynomus.

Features:

- It has 14 legs but uses these only to crawl along the bed of oceans in search of food.
- It measures around 50 cm in length, which is big for isopods, which normally do not grow beyond 33 cm.
- The only member of the isopod species that exceeds the raksasa in size is the
 Bathynomus giganteus, which is commonly found in the deep waters of the western
 Atlantic Ocean.
- As a **scavenger**, it eats the remains of dead marine animals, such as whales and fish, but can also go for long periods without food, a trait that it shares with the cockroach.

Significance:

- It is the first recorded species of the genus Bathynomus from Indonesia.
- It is the **sixth 'supergiant' species** from the Indo-West Pacific, and is one of the largest known members of the genus Bathynomus.
- It's discovery will contribute towards increasing knowledge about the deep sea.
