

Diabetes Mellitus and Tuberculosis

For Prelims: <u>Diabetes Mellitus</u> and <u>Tuberculosis</u>, <u>Epidemics</u>, Type 2 Diabetes, Tuberculosis,

Respiratory Infections.

For Mains: Diabetes Mellitus and Tuberculosis.

Source: TH

Why in News?

For a very long time, India has been experiencing the burden of two severe **Epidemics**, **Diabetes**Mellitus (DM) and **Tuberculosis (TB)**, however few know how deeply these **diseases** are interlinked.

Currently, India has around 74.2 million people living with diabetes while TB affects 2.6 million Indians every year.

How Are DM and TB Interlinked?

- Risk of Developing Respiratory Infections:
 - The DM increases the **risk of developing respiratory infections.** DM is a major risk factor that increases the incidence and severity of TB.
 - Among people with TB, the prevalence of DM was found to be 25.3% while 24.5% were pre-diabetic, in a 2012 study in tuberculosis units in Chennai.
- **DM** Hampers the Recovery of TB:
 - DM not only increases the risk of TB but also hampers the recovery process and prolongs the time for TB bacteria to be eliminated from the body.
 - The impaired cell-mediated immunity in DM affects the body's ability to fight infections, including TB.
- Alters the Defense Mechanism:
 - Uncontrolled DM alters the defense mechanisms in the lungs, making individuals more susceptible to TB infection.
 - Additionally, the altered functions of small blood vessels in the lungs and poor nutritional status, common in DM, create an environment that facilitates the invasion and establishment of TB bacteria.
- Likelihood of Unfavorable TB Treatment Outcomes:
 - DM increases the likelihood of unfavorable TB treatment outcomes, such as treatment failure, relapse/reinfection, and even death.
 - The coexistence of TB and DM in patients may also **modify TB symptoms**, **radiological findings**, **treatment**, **final outcomes**, and prognosis.
 - The dual burden of DM and TB not only impacts the health and survival of individuals but also places a significant burden on the healthcare system, families, and communities.

What can be done to Tackle Both DM and TB?

- Provide individualized care for TB and DM patients, integrating treatments and addressing comorbidities.
- Improve patient education, support, and nutrition to enhance TB treatment outcomes.
- Strengthen healthcare programs for TB and DM, build resilient and integrated health systems, and use research to inform evidence-based decision-making.

What is Diabetes Mellitus (DM)?

About:

- DM is a disorder in which the **body does not produce enough or respond normally to insulin,** causing blood sugar (glucose) levels to be abnormally high.
- The name Diabetes Mellitus is often used rather than diabetes alone, to distinguish this disorder from **Diabetes Insipidus.**
 - Diabetes insipidus is a relatively rare disorder that does not affect blood glucose levels but, just like diabetes mellitus, **causes increased urination.**
- While 70-110 mg/dL fasting blood glucose is considered normal, blood glucose levels between 100 and 125 mg/dL is considered prediabetes, and 126 mg/dL or higher is defined as diabetes.

Types:

Type 1 Diabetes:

- The body's immune system **attacks the insulin-producing cells** of the pancreas, and more than 90% of them are **permanently destroyed.**
- The pancreas, therefore, produces little or no insulin.
- Only about 5 to 10% of all people with diabetes have type 1 disease. Most people
 who have type 1 diabetes develop the disease before age 30, although it can
 develop later in life.

• Type 2 Diabetes:

- The pancreas often continues to produce insulin, sometimes even at higher-thannormal levels, especially early in the disease.
- However, the body develops resistance to the effects of insulin, so there is not
 enough insulin to meet the body's needs. As type 2 diabetes progresses,
 the insulin-producing ability of the pancreas decreases.
 - Type 2 diabetes was once rare in children and adolescents but has become more common. However, it usually begins in people older than 30 and becomes progressively more common with age.
 - About 26% of people older than 65 have type 2 diabetes.

What is Tuberculosis (TB)?

- Tuberculosis is an infectious disease that can cause infection in your lungs or other tissues.
- It commonly affects lungs, but it can also affect other organs like your spine, brain or kidneys.
- TB is caused by **a bacterium called Mycobacterium tuberculosis.** The bacteria usually attack the lungs, but TB bacteria can attack any part of the body such as the kidney, spine, and brain.
- The three stages of TB are:
 - Primary infection.
 - Latent TB infection.
 - Active TB disease.
