

Mysterious Liver Disease

Why in News?

Recently, some Cases of a **Mysterious Liver Disease** have been reported in Spain, Denmark and the Netherlands, besides the US and UK.

What is this Mysterious Disease?

About:

- Children between the **age of 1 to 6 years old** have been the target of the disease.
- According to reports, the disease might be related to <u>virus</u> usually associated with colds.
- The disease has been reported to be severe so far. Though no children died so far in the US, UK, six children needed liver transplants.

Symptoms:

- The symptoms are general liver diseases like <u>hepatitis</u> or liver inflammation but the cause remains unknown.
- Jaundice, diarrhoea and abdominal pain has been reported.

Probable Causes:

- Laboratory testing has ruled out the **hepatitis** type A, B, C and E viruses that usually cause such illnesses. The role of international travel, if any, is not yet known.
- Maybe a group of viruses called <u>adenoviruses</u>, which cause common respiratory illnesses such as the common cold.
 - Some of the European children tested positive for adenovirus, and some tested positive for <u>Covid-19</u>.
 - Adenoviruses are preferred for vaccines because their <u>DNA (DeoxyRiboNucleic Acid)</u> is double stranded which makes them genetically more stable and the chances of them changing after injection are lower.
- As per their analyses, there could be a possible association of hepatitis with Adenovirus 41.
