

Polio

For Prelims: Polio, Universal Immunisation Programme, WHO.

For Mains: Government Policies & Interventions, Polio, its spread, vaccine and eradication measures.

Why in News?

With the possibility of a new <u>Covid-19 variant</u> triggering a fresh surge in cases, the <u>Centre has told the states to send sewage samples to all sentinel sites that currently carry out surveillance of <u>Poliovirus</u>.</u>

■ **Sentinel surveillance** is the "monitoring of rate of occurrence of specific diseases/conditions through a voluntary network of doctors, laboratories and public health departments with a view to assess the stability or change in health levels of a population".

What is Polio?

- About:
 - Polio is a crippling and potentially deadly viral infectious disease that affects the nervous system.
 - There are three individual and immunologically distinct wild poliovirus strains:
 - Wild Poliovirus type 1 (WPV1)
 - Wild Poliovirus type 2 (WPV2)
 - Wild Poliovirus type 3 (WPV3)
 - Symptomatically, all three strains are identical, in that they cause irreversible paralysis or even death.
 - However, there are **genetic and virological differences**, which make these three strains separate viruses which must each be eradicated individually.
- Spread:
 - The virus is transmitted by person-to-person mainly through the faecal-oral route or, less frequently, by a common vehicle (for example, through contaminated water or food).
 - It largely affects children under 5 years of age. The virus multiplies in the intestine, from where it can invade the nervous system and can cause paralysis.
- Symptoms:
 - Most people with polio do not feel sick. Some people have only minor symptoms, such as fever, tiredness, nausea, headache, pain in the arms and legs, etc.
 - In rare cases, polio infection causes permanent loss of muscle function (paralysis).
 - Polio can be fatal if the muscles used for breathing are paralysed or if there is an infection of the brain.
- Prevention and Cure:
 - There is no cure, but it can be prevented through **Immunisation.**
- Vaccines:
 - Oral Polio Vaccine (OPV): It is given orally as a birth dose for institutional deliveries, then primary three doses at 6, 10 and 14 weeks and one booster dose at 16-24 months of age.

Injectable Polio Vaccine (IPV): It is introduced as an additional dose along with the 3rd dose
of <u>DPT (Diphtheria, Pertussis and Tetanus)</u> under the <u>Universal Immunisation</u>
Programme (UIP).

Recent Outbreaks:

- In 2019, polio outbreaks were recorded in the Philippines, Malaysia, Ghana,
 Myanmar, China, Cameroon, Indonesia and Iran, which were mostly vaccine-derived in which a rare strain of the virus genetically mutated from the strain in the vaccine.
 - According to the <u>WHO (World Health Organisation)</u>, if the oral vaccine-virus is excreted and allowed to circulate in an unimmunised or under-immunised population for at least 12 months, it can mutate to cause infections.

India & Polio:

- India received polio-free certification by the WHO in 2014, after three years of zero cases.
 - This achievement has been spurred by the successful **Pulse Polio Campaign** in which all children were administered polio drops.
 - The last case due to wild poliovirus in the country was detected on 13th January 2011.

What are the Polio Eradication Measures?

Global:

- Global Polio Eradication Initiative:
 - It was launched in 1988 by the Global Polio Eradication Initiative (GPEI), by national governments and <u>World Health Organization (WHO)</u>. Presently, 80% of the world's population is now living in certified polio-free regions.
 - An estimated 1.5 million childhood deaths have been prevented, through the systemic administration of vitamin A during polio immunisation activities.

World Polio Day:

 It is observed every year on 24th October in order to call on countries to stay vigilant in their fight against the disease.

Indian:

- Pulse Polio Programme:
 - It was started with an objective of achieving hundred percent coverage under Oral Polio Vaccine.
- Intensified Mission Indradhanush 2.0:
 - It was a nationwide immunisation drive to mark the 25 years of <u>Pulse polio programme</u> (2019-20).
- Universal Immunization Programme (UIP):
 - It was launched in 1985 with the modification to **'Expanded Programme of Immunization (EPI).**
 - The objectives of the Programme include: Rapidly increasing immunisation coverage, Improving the quality of services, Establishing a reliable cold chain system to the health facility level, Introducing a district-wise system for monitoring of performance, Achieving self-sufficiency in vaccine production.
