Indigenous Mpox Detection RT-PCR kit Developed

Source: IE

Recently, **India** has developed an indigenous **Reverse transcription polymerase chain reaction (RT-PCR) testing kit** for detecting **Mpox** (previously known as monkeypox).

- These kits are developed by Siemens Healthcare, Transasia Diagnostics, and JITM C Genes which are approved by the <u>Central Drugs Standard Control Organization (CDSCO)</u>.
- The new RT-PCR kits provide results in 40 minutes, compared to traditional methods, which take one to two hours.
 - These RT-PCR kits ensure detection across both clade I and clade II variants.
- Mpox: Mpox is a viral illness caused by the monkeypox virus. It has two distinct variants namely clade I and clade II.
 - It was first discovered in humans in 1970 in the **Democratic Republic of the Congo.**
 - Mpox spreads through close contact like skin-to-skin, mouth-to-mouth, or mouth-toskin interactions, as well as face-to-face contact (talking).
 - WHO declared Mpox, a <u>public health emergency of international concern (PHEIC)</u> twice, the first time in May 2022 and the second time in August 2024.
 - The first Mpox cases were reported in India in 2022.
