

Lightning Killed Many | Chhattisgarh | 25 Sep 2024

Why in News?

Recently, a devastating lightning strike in Chhattisgarh's Rajnandgaon claimed the lives of several people, including children, during heavy rainfall.

Key Points

Lightening in India:

- Lightning is a powerful and visible electrical phenomenon that takes place when there is a buildup of electrical charges within clouds and between clouds and the ground.
 - The discharge of this electrical energy results in a brilliant flash of light and a rapid expansion of air, creating the characteristic thunder that accompanies lightning.
 - Cloud-to-ground (CG) lightning is dangerous because it can electrocute people due to its high electric voltage and current.
- India ranks among the five countries worldwide with an early warning system for lightning.
 - The system provides forecasts ranging from five days to as close as three hours before the occurrence of lightning.

Lightning Fatalities: Statistics and Trends

- National Crime Records Bureau (NCRB) Data: In 2021, lightning accounted for 2,880 deaths, comprising 40% of all accidental deaths caused by "forces of nature."
 - The trend indicates an increase in lightning-related fatalities compared to other natural events.

Geographical Distribution in India:

- Lightning frequency is highest in northeastern states and West Bengal, Sikkim, Jharkhand, Odisha, and Bihar.
 - However, the number of lightning-related deaths is higher in central Indian states like **Madhya Pradesh**, **Maharashtra**, **Chhattisgarh**, and **Odisha**.
- Bihar is one of the most vulnerable states to lightning strikes, with a significant number of deaths reported annually.
 - In 2023, till July 6, Bihar recorded 107 deaths due to lightning.

Union Government's View About Lightning:

 The Union government opposes declaring lightning a <u>natural disaster</u>. The government believes that education and awareness can help prevent lightning-related deaths effectively.

Possible Factors Behind the Increasing Trend of Lightning Strikes

- **Climate Change:** Global warming and climate change could potentially influence atmospheric conditions, leading to an increase in thunderstorms and lightning activity.
 - As the planet's temperature rises, there may be changes in the distribution of moisture, instability, and convective processes that could favor more frequent lightning occurrences.
 - Kalbaisakhi is a localised thunderstorm occurrence that is accompanied by lightning, typically observed during the pre-monsoon season in the Indian subcontinent.
- **Urbanization**: The expansion of urban areas can create what is known as the "<u>urban heat island</u> effect."
 - Cities tend to be warmer than surrounding rural areas due to increased human activity, energy consumption, and impervious surfaces.

- These localized heat islands may lead to the formation of more thunderstorms and, consequently, an increase in lightning strikes.
- Land Use Changes: <u>Deforestation</u>, changes in agricultural practices, and alterations of natural landscapes may disrupt local atmospheric conditions.
 - Such changes might contribute to the development of thunderstorms and, consequently, more lightning.
- **Pollution and Aerosols**: Air pollution, including aerosols and particulate matter, can affect cloud formation and electrical activity within storms.
 - <u>Anthropogenic emissions</u> might influence the frequency and intensity of thunderstorms, potentially leading to more lightning strikes.
