

Aravalli Fire

Why in News?

As temperatures rose, a forest fire broke out in the Aravallis near Surajkund in Faridabad.

 Despite the fire department successfully putting out the flames within half an hour, locals claimed that several acres of land and trees had already been burnt.

Key Points

- Aravallis are fold mountains of which rocks are formed primarily of folded crust, when two
 convergent plates move towards each other by the process called orogenic movement.
 - The Aravallis of Northwestern India, one of the oldest fold mountains of the world, now form residual mountains with an elevation of 300m to 900m. They stretch for a distance of 800 km. from Himmatnagar in Gujarat to Delhi, spanning Haryana, Rajasthan, Gujarat, and Delhi, the 692 kilometre.
 - The hidden limb of the Aravallis that extends from Delhi to Haridwar creates a divide between the drainage of rivers of the Ganga and the Indus.
- The Aravallis date back to millions of years when a pre-Indian subcontinent collided with the mainland **Eurasian Plate**. Carbon dating has shown that copper and other metals mined in the ranges date back to at least 5th century BC.
- The mountains are divided into two main ranges the **Sambhar Sirohi Range** and the **Sambhar Khetri Range** in Rajasthan, where their extension is about 560 km.
