

Air Independent Propulsion for Diesel Electric Submarines

Why in News

The <u>Defence Research and Development Organisation (DRDO)</u> has conducted the final development test of <u>Air Independent Propulsion (AIP) System</u>, crucial for diesel electric submarines.

Key Points

- Air Independent Propulsion (AIP) System:
 - Submarines are essentially of two types: conventional and nuclear.
 - The **conventional submarines use diesel-electric engines**, which require them to surface almost daily to get atmospheric oxygen for fuel combustion.
 - If fitted with an Air Independent Propulsion (AIP) system, the submarine will need to take in oxygen only once a week.
 - The indigenously-developed AIP, which is one of the key missions of the Naval Materials Research Laboratory (NMRL), is considered one of the ambitious projects of the DRDO for the Navy.
 - The project aims at fitting the technology on India's Scorpene class submarine INS Kalvari around 2023.
- Advantages of AIP:
 - The AIP system based submarines will be required to surface much less frequently, thus increasing their lethality and stealth multifold.
 - Diesel-electric submarines require them to come to the surface frequently to charge their batteries, thus their underwater endurance time is less.
 - 'Air-independent' propulsion technology helps to make the diesel generator less dependent on surface air.
 - While there are different types of AIP systems being pursued internationally, fuel cell-based AIP of NMRL is unique as the hydrogen is generated onboard.
- Fuel Cell Based AIP system:
 - In a <u>fuel cell</u> based AIP, an electrolytic fuel cell releases energy by combining hydrogen and oxygen, **with only water as the waste product** ensuring less marine pollution.
 - The cells are highly efficient, and do not have moving parts, thus ensuring that the submarine has a low acoustic emissions of sound.

Naval Materials Research Laboratory

- Naval Materials Research Laboratory (NMRL) is one of the laboratories functioning under DRDO, pursuing basic research as well as application-oriented technology development in several areas viz. Metallurgy, Polymer, Ceramics, Coating, Corrosion and Electrochemical Protection, Marine Biotechnology, Environmental Sciences.
- It's mission:

- To develop Air Independent Propulsion (AIP) systems for Naval Submarine & Fuel Cell technologies.
- To provide scientific solutions for all categories of materials & related technologies for Indian Navy.
- To undertake research projects on strategic materials for Indian Navy.

Nuclear Submarines versus Conventional Submarines

- The main difference between conventional submarines and nuclear submarines is the **power generation system.** Nuclear submarines (e.g <u>INS Arihant, INS Akula</u>) employ nuclear reactors for this task and conventional submarines (e.g <u>Project-75</u> **and** <u>Project-75</u>! **Class Submarines**) use diesel-electric engines.
- While nuclear-powered submarines are considered as key assets for deep sea operations, the conventional diesel electric ones are vital for coastal defence and operations close to the shore.
