

Humboldt Penguin

Why in News

Recently, Mumbai's Byculla Zoo announced the addition of two new Humboldt penguin chicks.

Key Points

About: //

- Humboldt penguins (Spheniscus Humboldti) are a medium-sized species with an average height of just over 2 ft.
- They have large, bare skin patches around their eyes, an adaptation to help keep them cool.
- Their breeding season in the wild is either March-April or September-October depending on the location of the colony.
- They are **one of the most popular zoo penguins** due to their ability to withstand warmer climates.

Habitat:

- Humboldt penguins are endemic to the Pacific coasts of Chile and Peru.
 - They are so named because their habitat is **located near the Humboldt Current**, a large **oceanic upwelling characterised by cold waters**.

Threats:

• Entanglement in fishing nets, loss of key breeding sites, harvesting of guano for use as

fertiliser, and being hunted by introduced species such as cats and dogs.

Protection Status:

IUCN: VulnerableCITES: Appendix I
