

## Wildfires Threaten Uttarakhand's Wildlife and Ecological Balance

## Why in News?

The <u>wildfires in Uttarakhand's forests</u> are **endangering the state's rich wildlife**, which includes <u>tigers</u>, <u>elephants</u>, <u>leopards</u>, as well as a range of <u>birds</u> and <u>reptiles</u>.

## **Key Points**

- The ecosystem is under severe pressure, particularly for birds and reptiles who are having difficulty fleeing the fires due to their limited mobility.
- According to environmental photographer, wildfires have resulted in the tragic loss of numerous bird species, including nesting ones.
- A conservator of forests (research), is concerned about the critically endangered yellowheaded tortoise as they are at increased risk during the fire season when they seek shelter under dried <u>Sal leaves.</u>
  - The loss of even a small number of these tortoises could have a significant impact on the survival of the species, considering their already declining population.
- Gajendra Pathak, associated with the Jungle Bachao Jeevan Bachao campaign, emphasizes the wider ecological consequences of the wildfires.
  - The burning of leaves not only damages wildlife but also interferes with the important humus layer vital for soil health and erosion prevention.
  - The disappearance of insects such as beetles, ants, and spiders adds to the challenges of maintaining the fragile ecological equilibrium.

## Yellow-Headed Tortoise

• Scientific name: Indotestudo elongate.

- **Common name:** Elongated tortoise, Yellow Tortoise and Sal forest tortoise.
- Distribution: It is a species of tortoise found in Southeast Asia and parts of the Indian Subcontinent, particularly Northeast India.
- Physical description: These up to 1 foot-long tortoises have elongated somewhat narrow carapaces and yellow heads. Shells are typically a pale tannish-yellow to caramel color, with blotches of black.
- IUCN Red List Status: Critically Endangered.
- Population: According to the IUCN the population of the species may have fallen by about 80% in the last three generations (90 years).
- Threats: It is heavily hunted for food and collected both for local use, such as decorative masks, and international wildlife trade. In china, a mixture, made by grinding up the tortoise's shell, also serves as an aphrodisiac.
