

## **Robots in Warfare**

### Why in News

Recently, **Israel Aerospace Industries** unveiled a remote-controlled **armed robot 'REX MKII'**, which can patrol battle zones, track infiltrators and open fire.

- The use of robots in the war involves dealing with **ethical dilemmas.**
- The proponents say that such semi-autonomous machines allow armies to protect their soldiers, while critics fear this marks another dangerous step toward robots making life-ordeath decisions.

## **Key Points**

#### About the REX MKII:

- The robot can gather intelligence for ground troops, carry injured soldiers and supplies in and out of battle, and strike nearby targets.
- The Israeli military is currently using a smaller but similar vehicle called the Jaguar to patrol the border with the Gaza Strip.
- Unmanned ground vehicles are being increasingly used by other armies, including those of the United States, Britain and Russia.
  - Their tasks include logistical support, the removal of mines and firing weapons.
  - An alternative **Smart Wall** has been proposed to replace the physical and armed patrolling with advanced surveillance technology at the USA-Mexico border.
- Arguments in Favour of Use of Robots in War:
  - No Physiological Limitations: Autonomous robots, because they are not physiologically limited, can operate without sleep or food, perceive things that people do not, and move in ways that humans cannot.
    - The use of a broad range of robotic sensors is better equipped for battlefield observations than human sensory abilities.
  - Operational Benefits to the Military: The robots provide following benefits: faster, cheaper, better mission accomplishment; longer range, greater persistence, longer endurance, higher precision; faster target engagement; and immunity to chemical and biological weapons.
  - Ability to Act Conservatively: Robots do not need to protect themselves in cases of low certainty of target identification.
    - Autonomous armed robotic vehicles do not need to have self-preservation as a foremost drive, if at all.
    - They can be used in a self-sacrificing manner if needed and appropriate, without reservation by a commanding officer.
  - Minimising Loss of Human Life: Reducing loss of human lives forms one of the core principles of ethics of war, which can be accomplished by the use of the robots.
- Arguments Against the Use of Robots in War:

- **Lowering Threshold of Entry into War:** The use of robot soldiers will cheapen the cost of war, making future wars more likely.
  - The threshold of entry into warfare may be lowered as we will now be risking machines and fewer human soldiers.
  - This could violate the conditions of just warfare.
- Errors in Targeting: Such weapons are worrisome because they can't be trusted to
  distinguish between combatants and civilians or make proper calls about the harm attacks
  may do to nearby civilians.
- **Ignoring Conventions of War:** Machines cannot understand the value of human life, which in essence undermines human dignity and violates human rights laws.
  - Therefore, machines are likely to commit atrocities and violate the basic rules of war like the Hague Conventions, and other declarations delimiting how a war should be fought.
- Persistent Risks: There will always be risks like proliferation of the technology to other nations and terrorists.
  - Also, the robotic machines are prone to cyber-security attacks or hacking and they can be used against their own people.
- Security Management in India:
  - <u>CIBMS Project</u>: The Indian government has been pushing for technological solutions through the <u>Comprehensive Integrated Border Management System</u> (<u>CIBMS</u>) project. The purpose is to integrate technology with the existing systems to facilitate better detection and interception by the man behind the machine.
  - National Counter Rogue Drones Guidelines 2019: To deal with possible security challenges from rogue drones to key installations like nuclear power plants and military bases.

# **Way Forward**

- Technological revolution propelled by <u>Artificial Intelligence</u>, <u>Machine learning</u>, etc, is the need
  of the hour to enhance efficiency, productivity and optimization across industries and sectors.
- However, before deployment of robotics into warfare, thorough research needs to be done, so that
  opportunities can be maximized while keeping the humanitarian loss at the minimum.
