

Tubeless Conundrum

- **Tubeless tyres** are tyres that do not have **an inner tube** and hold the **air inside** the tyre itself. A tubeless tyre resembles a tubed tyre.
- Tubeless tyres have advantages over conventional tubed tyres, such as **cooler running, reduced downtime, and safer handling.**
- These are not popular in India because of two main reasons: **rusting of rims** and the need for **special tools for repairs.**
 - Rusting of rims causes **air leaks** and reduces the **sealing of tubeless tyres.** Special tools and presses are required to fit and remove tubeless tyres, which are not available in roadside shops
