

Cyclone 'Dana' Impact on Bihar

Why in News?

Recently, <u>Cyclone</u> '**Dana**' has caused significant changes in the weather pattern across Bihar, leading to heavy rainfall warnings for several districts.

Key Points

- Affected Districts: Patna, Gaya, and other nearby regions are likely to experience significant rainfall.
 - The <u>India Meteorological Department (IMD)</u> has issued a <u>yellow alert</u>, warning residents to prepare for potential flooding.
 - Cyclone Dana is also influencing weather conditions in neighboring states like Jharkhand and West Bengal.
- Colour- Coded Weather Warning:
 - It is issued by the IMD whose objective is to alert people ahead of severe or hazardous weather which has the potential to cause damage, widespread disruption or danger to life.
 - The IMD uses 4 color codes are:
 - Green (All is well): No advisory is issued.
 - **Yellow (Be Aware):** Yellow indicates severely bad weather spanning across several days. It also suggests that the weather could change for the worse, causing disruption in day-to-day activities.
 - **Orange/Amber (Be prepared):** The orange alert is issued as a warning of extremely bad weather with the potential of disruption in commute with road and rail closures, and interruption of power supply.
 - Red (Take Action): When the extremely bad weather conditions are certainly going to disrupt travel and power and have significant risk to life, the red alert is issued.
 - These alerts are universal in nature and are also issued during floods, depending on the amount of water rising above land/in a river as a result of torrential rainfall.
 - For instance, when the water in a river is 'above normal' level, or between the 'warning' and 'danger' levels, a yellow alert is issued.

Cyclone

- <u>Cyclones</u> are rapid inward air circulation around a low-pressure area. The air circulates in an anticlockwise direction in the **Northern hemisphere and clockwise in the Southern hemisphere**.
- Cyclones are usually accompanied by violent storms and bad weather.
- The word Cyclone is derived from the Greek word Cyclos meaning the coils of a snake. It was coined by Henry Peddington because the tropical storms in the Bay of Bengal and the Arabian Sea appear like coiled serpents of the sea.
- There are two types of cyclones:
 - Tropical cyclones; and
 - Extra Tropical cyclones (also called Temperate cyclones or middle latitude cyclones or Frontal cyclones or Wave Cyclones).
- The <u>World Meteorological Organisation</u> uses the term 'Tropical Cyclone' to cover weather systems

in which winds exceed 'Gale Force' (minimum of 63 km per hour).

- Tropical cyclones develop in the region between the **Tropics of Capricorn and Cancer.**They are large-scale weather systems developing over tropical or subtropical waters, where they get organized into surface wind circulation.
- Extra tropical cyclones occur in temperate zones and high latitude regions, though they are known to originate in the Polar Regions.
