

Heatwaves Causing Major Wildfires in Russia

Source: DTE

Russia's wildfire season, spanning **eight regions** since early March 2024 is expected to bring prolonged periods of **"high" and "extreme" wildfire danger** across most of the country this year, continuing a trend seen in previous years, such as the **heatwaves** in Siberia in 2019 and 2022 that led to **devastating** wildfires.

- Verkhoyansk, a town in the Sakha Republic or Yakutia, known as the 'coldest inhabited place in the world,' recorded a temperature of 38 degrees Celsius in June 2020, likely the highest ever in the <u>Arctic Circle region</u>.
- Multiple regions in Russia, including the Jewish Autonomous Region and Khabarovsk Territory are currently under a state of emergency due to widespread wildfires.
- The Russian Hydrometeorological Centre has predicted that much of Russia will face extended periods of "high" and "extreme" wildfire risk this year.
