

Renewable Energy & Land Use in India

Why in News

Recently, a report named <u>Renewable Energy</u> and Land Use in India by Mid-Century suggested that careful planning today can maximise the benefits and minimise the costs of India's history-making <u>energy transition</u>.

- It was released by the Institute for Energy Economics and Financial Analysis (IEEFA) which examines issues related to energy markets, trends and policies.
- It's mission is to accelerate the transition to a diverse, sustainable and profitable energy economy.

Key Points

Land-Use for Renewables:

- India will use significant stretches of land by 2050 to install renewable energy generation capacities.
 - Around 50,000-75,000 square kilometres of land will be used in 2050 for solar energy generation and for an additional 15,000-20,000 sq km for wind energy projects.
- In India, electricity generation has to compete with alternative uses for land such as agriculture, <u>urbanisation</u>, human habitation and nature conservation, unlike Europe or the US.

Co-Existence:

 Properly managed renewable generation can co-exist with other land uses, and, unlike coal-based power, it does not fundamentally change land during use or following its ultimate decommissioning.

Carbon Emission:

- The resulting land cover changes, including indirect effects, will likely cause a net release
 of carbon up to 50 grams of carbon dioxide per kilowatt-hour (gCO2 / kwh).
- The amount of carbon release will depend on the region, scale of expansion, solar technology efficiency and land management practices at solar parks.

Effect on Ecosystems:

- Land use for renewable energy may put a pressure on a variety of ecosystems.
 Generally the terms zero impact areas, barren land, unused land or the official designation of wasteland imply that such areas have no value.
 - Open Natural Ecosystems (ONE), classified as wastelands, covered around 10% of India's land surface.
 - The **largest stretches** are found in Rajasthan, Madhya Pradesh, Maharashtra, Andhra Pradesh and Gujarat.
- However some of these have the "highest densities and diversity of large"

mammalian fauna" and also support livelihoods of local populations.

 Earlier the <u>Supreme Court</u> directed all power lines of solar power units passing through <u>Great Indian Bustard</u> habitats in Rajasthan and Gujarat to be laid underground - as the overhead transmission lines could threaten the endangered species.

Suggestions:

- Reduce Environmental Damage:
 - Optimising the size of land used, its location and impact on human habitation, agriculture and conservation of natural resources to reduce environmental damage.
- Minimizing Land Use:
 - Minimising total land-use requirements for renewable energy by promoting offshore wind, rooftop solar and solar on water bodies.
- Land Assessment:
 - Identification and assessment of land for renewable generation by limiting undue regional concentration and developing environmental and social standards for rating potential sites.
 - Policy makers and planners should exclude ONE with high density habitats when considering location of renewable energy projects.
- Incentivising Agri Voltaics:
 - Attention on Indian agri-voltaics sector securing benefits to farmers and
 incentivising agri voltaics uptake where crops, soils and conditions are suitable
 and yields can be maintained or improved.
 - **Agri voltaics** combine the agricultural use of land with the production of electric energy by photovoltaics.
