

Ethanol Production

For Prelims: <u>Curb on Sugar Diversion for Ethanol</u>, <u>Ethanol Blended Petrol (EBP)</u>, <u>Biofuels</u>, <u>Feedstocks</u>, <u>Crude Oil Import</u>, <u>Food Security</u>, <u>Global Biofuel Alliance</u>

For Mains: Ethanol Production, Indian Economy, and issues relating to planning, mobilization of resources, growth, development, and employment.

Source: LM

Why in News?

Recently, India has achieved <u>higher ethanol production</u> from grains, particularly <u>maize</u>, surpassing that from sugar-based feedstock.

What is Ethanol?

About:

- Ethanol, also known as ethyl alcohol, is a **biofuel** produced from various sources such as **sugarcane**, corn, rice, wheat, and biomass.
- Molasses, a byproduct of sugar manufacture, are generally the main source of production of ethanol (anhydrous alcohol) and rectified spirit. Molasses can be categorised into following:
 - A Molasses (First Molasses): An intermediate by-product from initial sugar crystal extraction, containing 80-85% dry matter (DM).
 - **B Molasses (Second Molasses):** Similar DM content as A molasses but with less sugar and no spontaneous crystallization.
 - C Molasses (Final Molasses, Blackstrap Molasses, Treacle): The end byproduct of sugar processing, containing significant amounts of sucrose (about 32 to 42%). It does not crystallize and is used as a commercial feed ingredient in liquid or dried form.
- The production process involves the **fermentation of sugars** by yeasts or via petrochemical processes such as ethylene hydration.
- Ethanol is 99.9% pure alcohol that can be blended with petrol to create a cleaner fuel alternative.

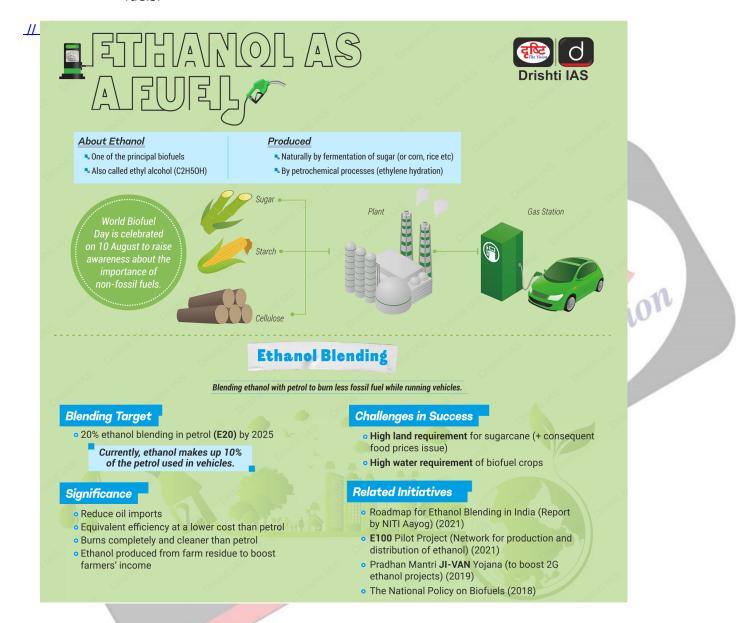

Properties of Ethanol:

- Ethanol is a **clear, colorless liquid** with a characteristic wine-like odor and pungent taste.
- It is **fully soluble in water** and most organic solvents.
- In its pure form, it has a boiling point of 78.37 degrees Celsius and a melting point of -114.14 degrees Celsius.
- Ethanol is a **combustible material** and has a lower combustion temperature than gasoline, making it a cleaner-burning alternative.

Applications of Ethanol:

• **Beverages:** Ethanol is the type of alcohol found in alcoholic beverages. It is consumed socially in various forms, such as **beer**, **wine**, **and spirits**.

- Industrial Solvent: Due to its ability to dissolve a wide range of substances, ethanol is
 used as a solvent in the manufacturing of pharmaceuticals, perfumes, and other
 products.
- Medical and Laboratory Uses: Ethanol is used as an antiseptic, disinfectant, and preservative in medical and laboratory settings.
- Chemical Feedstock: It serves as a feedstock for the production of various chemicals.
- **Fuel:** It is used as a biofuel and is often mixed with gasoline to produce ethanol-blended fuels.

What are the Measures to Promote Ethanol Production?

- Feedstock Diversification: Ethanol production in India was mainly based on 'C-heavy' molasses, with a sugar content of 40-45%, yielding 220-225 litres of ethanol per tonne.
 - Earlier, India explored direct sugarcane juice for ethanol production, increasing yield and efficiency.
 - However, India is using other methods also for increasing production. The country has
 diversified its feedstocks by including <u>rice</u>, damaged grains, <u>maize</u>, jowar, bajra,
 and <u>millets</u>.
 - It has been seen that Ethanol **yields from grains are higher** compared to molasses, with rice producing 450-480 liters and other grains 380-460 liters per tonne.
 - By 9 June 2024, India produced 3.57 billion litres of ethanol.

- Out of this, 1.75 billion litres were from sugar-based feedstock (sugarcane juice, B-heavy molasses, C-heavy molasses) and 1.81 billion litres were from grain-based feedstock with maize alone contributing 1.10 billion litres.
- **Grain-based ethanol** now constitutes nearly 51% of the total ethanol production for the current ethanol-supply year (November 2023-October 2024).
- The <u>National Agricultural Cooperative Marketing Federation of India Ltd</u>
 (<u>NAFED</u>) and the <u>National Cooperative Consumers' Federation of India Ltd</u>
 (<u>NCCF</u>) are procuring maize to promote its use in ethanol production.
- Moreover, Leading sugar companies have installed distilleries that can operate on multiple feedstocks such as rice, damaged grains, maize, and millets throughout the year for continuous production.
- **Government's Differential Pricing Policy:** The government has fixed different prices for ethanol derived from C heavy molasses, B heavy molasses, sugarcane juice/sugar/sugar syrup, and damaged food grains or rice.
 - For example, from 2018-19, the Indian government began fixing **higher prices for ethanol produced** from **B-heavy molasses** and whole sugarcane juice/syrup.
 - This policy has helped increase the supply of ethanol for the Ethanol Blended Petrol (EBP).
 - <u>E20</u> fuel is a blend of 20% ethanol and 80% petrol. The E20 was launched by the Prime Minister of India in February 2023 in Bengaluru.
 - This pilot covers at least 15 cities and will be rolled out across the country in a phased manner.

Setting up Ambitious Targets:

- India has set up a very ambitious target to increase Ethanol production in the country. For Instance, India plans to start using 20% ethanol blended petrol (E20) from 2025.
 - As of 9 June 2024, India achieved a 12.7% ethanol blend with petrol, targeting 15% for the current year.
 - Achieving the <u>E20 target</u> by 2025-26 will require 10.16 billion litres of ethanol, according to NITI Aayog estimates.

International Commitments:

- At the 64th <u>International Sugar Organization</u> meeting, India reaffirmed the commitment to achieving 20% ethanol blending by 2025-26, predicting that grain-based ethanol production will exceed sugar-based ethanol in the 2023-24 supply year.
- In September 2023, India, the US, the UAE, and Brazil launched the <u>Global Biofuel</u>
 <u>Alliance</u>. The countries agreed to provide financial and technical support to national
 programmes to promote the sustainable production and use of biofuels.

Other Policies:

- National Policy on Biofuels 2018
- E100 Pilot project
- Pradhan Mantri JI-VAN Yojana 2019
- Repurpose Used Cooking Oil (RUCO)

What are the Benefits and Challenges of Ethanol Production?

Benefits:

- Reduced Dependence on Oil Imports: India imports a significant portion of
 its <u>crude oil</u> needs. A <u>NITI Aayog</u> report estimates that a successful ethanol blending
 program can save the country billions of dollars annually by reducing this reliance.
- Boost to Agricultural Income: Increased ethanol production creates demand for crops like sugarcane and grains used in <u>fermentation</u>. This can lead to higher income for farmers according to a report by the International Renewable Energy Agency (IRENA).
- Greenhouse Gas Reduction: Ethanol absorbs carbon dioxide during its

production, **offsetting combustion emissions** and supporting India's carbon footprint reduction goals.

- Job Creation: The ethanol blending program has the potential to generate millions of jobs in rural areas. New distilleries, expanded sugarcane cultivation, and associated logistics will require a significant workforce, boosting the rural economy.
- Waste Management Solution: The ethanol production can utilize molasses that often creates waste disposal challenges. By converting molasses into ethanol, the program promotes a more sustainable approach to waste management within the sugar sector.
- Benefitting from the By products of Ethanol Production: Apart from being a fuel additive, ethanol production yields valuable byproducts like Distillers' Dried Grain with Solubles, and Potash from Incineration Boiler Ash that find applications across various industries.

• Distillers' Dried Grain with Solubles (DDGS):

- DDGS is a byproduct of grain-based ethanol production.
- It is the residue left after the starch in grains is fermented and ethanol is extracted.
- DDGS is a valuable animal feed with <u>high protein content</u> and is used to supplement livestock diets.

Potash from Incineration Boiler Ash:

- The ash remaining after Ethanol Production in the boiler contains up to 28% potash.
- This ash is a rich source of potash and can be utilized as a fertilizer.

Challenges:

- Food vs. Fuel: A major challenge is the competition for feedstocks between food
 production and ethanol production. According to the Environmental Protection Agency
 (EPA), corn-based ethanol production can lead to increased food prices and even
 contribute to deforestation in countries pressured to cultivate more land for crops.
- Land and Water Use: Large-scale ethanol production, particularly from corn, requires significant amounts of land and water. This can strain resources and lead to issues like soil erosion and depletion of freshwater supplies.
- Limited Environmental Benefit: While touted as a renewable fuel, the lifecycle <u>greenhouse gas emissions</u> of corn ethanol can be comparable to gasoline, especially when considering indirect land-use changes.
- Costly Processing: The current methods for processing feedstocks, particularly non-food crops like switchgrass, often require energy-intensive treatments to convert them into usable sugars for fermentation.
- Infrastructure Challenges: Ethanol has a higher water content than gasoline, which can lead to corrosion in pipelines and storage tanks.
- Shortage of Raw Material: Though India has planned to achieve Ethanol Blending by 2025 but it often finds raw material shortage for ethanol production. For Example, due to a lower production of sugarcane, the government in December 2023 banned the use of cane juice and B-heavy molasses for ethanol production.

Way Forward

- Promoting Second-Generation (2G) Ethanol Technologies: The potential of 2G technologies
 using agricultural waste like straw and bagasse for ethanol production can be harnessed to
 reduce competition for food crops and promote sustainability.
 - India can leverage Global Fuel Alliance to develop and provide its members with technology that is both technically feasible and economically viable for producing ethanol from agricultural waste.
- Developing Alternative Feedstocks and Crop Diversity: India can emulate Brazil's ethanol success by using non-food crops like sorghum and miscanthus to diversify feedstock and enhance food security.
- Financial Incentives for Biomass Cultivation and Farmer Integration: The World Bank

reports emphasize the need for financial incentives, contract farming models, and guaranteed buyback programs to encourage farmers to cultivate dedicated biofuel crops and ensure a steady feedstock supply.

- Investing in Research and Development for Improved Efficiency: Focusing on advancements in technologies like cellulosic ethanol production, along with increased research funding and international collaboration, can significantly improve ethanol yields.
- Strengthening Infrastructure and Streamlining Logistics: Data from government reports
 points to the need for significant investments in storage facilities and transportation networks
 for ethanol.
 - Public-private partnerships and **innovative logistics solutions** can ensure efficient distribution and program scalability.

Drishti Mains Ouestion:

Q. Discuss the various measures India has taken to achieve its E20 program. Highlight the challenges associated with this initiative.

UPSC Civil Services Examination, Previous Year Question (PYQ)

Prelims:

- Q. According to India's National Policy on Biofuels, which of the following can be used as raw materials for the production of biofuels? (2020)
 - 1. Cassava
 - 2. Damaged wheat grains
 - 3. Groundnut seeds
 - 4. Horse gram
 - 5. Rotten potatoes
 - 6. Sugar beet

Select the correct answer using the code given below:

- (a) 1, 2, 5 and 6 only
- **(b)** 1, 3, 4 and 6 only
- (c) 2, 3, 4 and 5 only
- (d) 1, 2, 3, 4, 5 and 6

Ans: (a)

- Q. Given below are the names of four energy crops. Which one of them can be cultivated for ethanol? (2010)
- (a) Jatropha
- (b) Maize
- (c) Pongamia
- (d) Sunflower

Ans: (b)
