

Little Bunting Bird

Why in News?

Recently, **birdwatchers spotted a** <u>little bunting</u> in <u>Mount Abu</u>, marking its first recorded appearance in Rajasthan.

Key Points

- Little Bunting Description and Habitat:
 - About:
 - Little bunting is a **small passerine bird** belonging to the bunting and sparrow family.
 - Its breeding range spans the taiga of far northeast Europe and northern Asia.
 - The bird **migrates to southern China and northeast India during winter** and typically inhabits agricultural areas, feeding on grains.
 - Features:
 - This is a **small bunting,** measuring only 12–14 cm (4.7–5.5 inch) in length.
 - It has white underparts with dark streaking on the breast and sides.
 - With its chestnut face and white malar stripe, it resembles a small female reed

bunting, but has black crown stripes, a white eye-ring, and a fine dark border to the rear of its chestnut cheeks.

the Vision

- IUCN Red List: Least Concern
- Possible Role of Climate Change:
 - Experts suggest <u>climate change</u> might have pushed the bird to Rajasthan, as it tends to avoid extremely cold conditions.
- Sightings in Northern India:
 - Little buntings have recently been spotted in regions like Gurugram, Chandigarh, and northern Punjab.
 - These birds are typically seen in the subtropics of northern India, southern China, and northern Southeast Asia.
- Significance for Conservation:
 - The sighting emphasizes the importance of **preserving forest areas and** <u>wetlands</u> to support such migratory species.
