

Conservation of Cephalopods

[Source: TH](#)

Why in News?

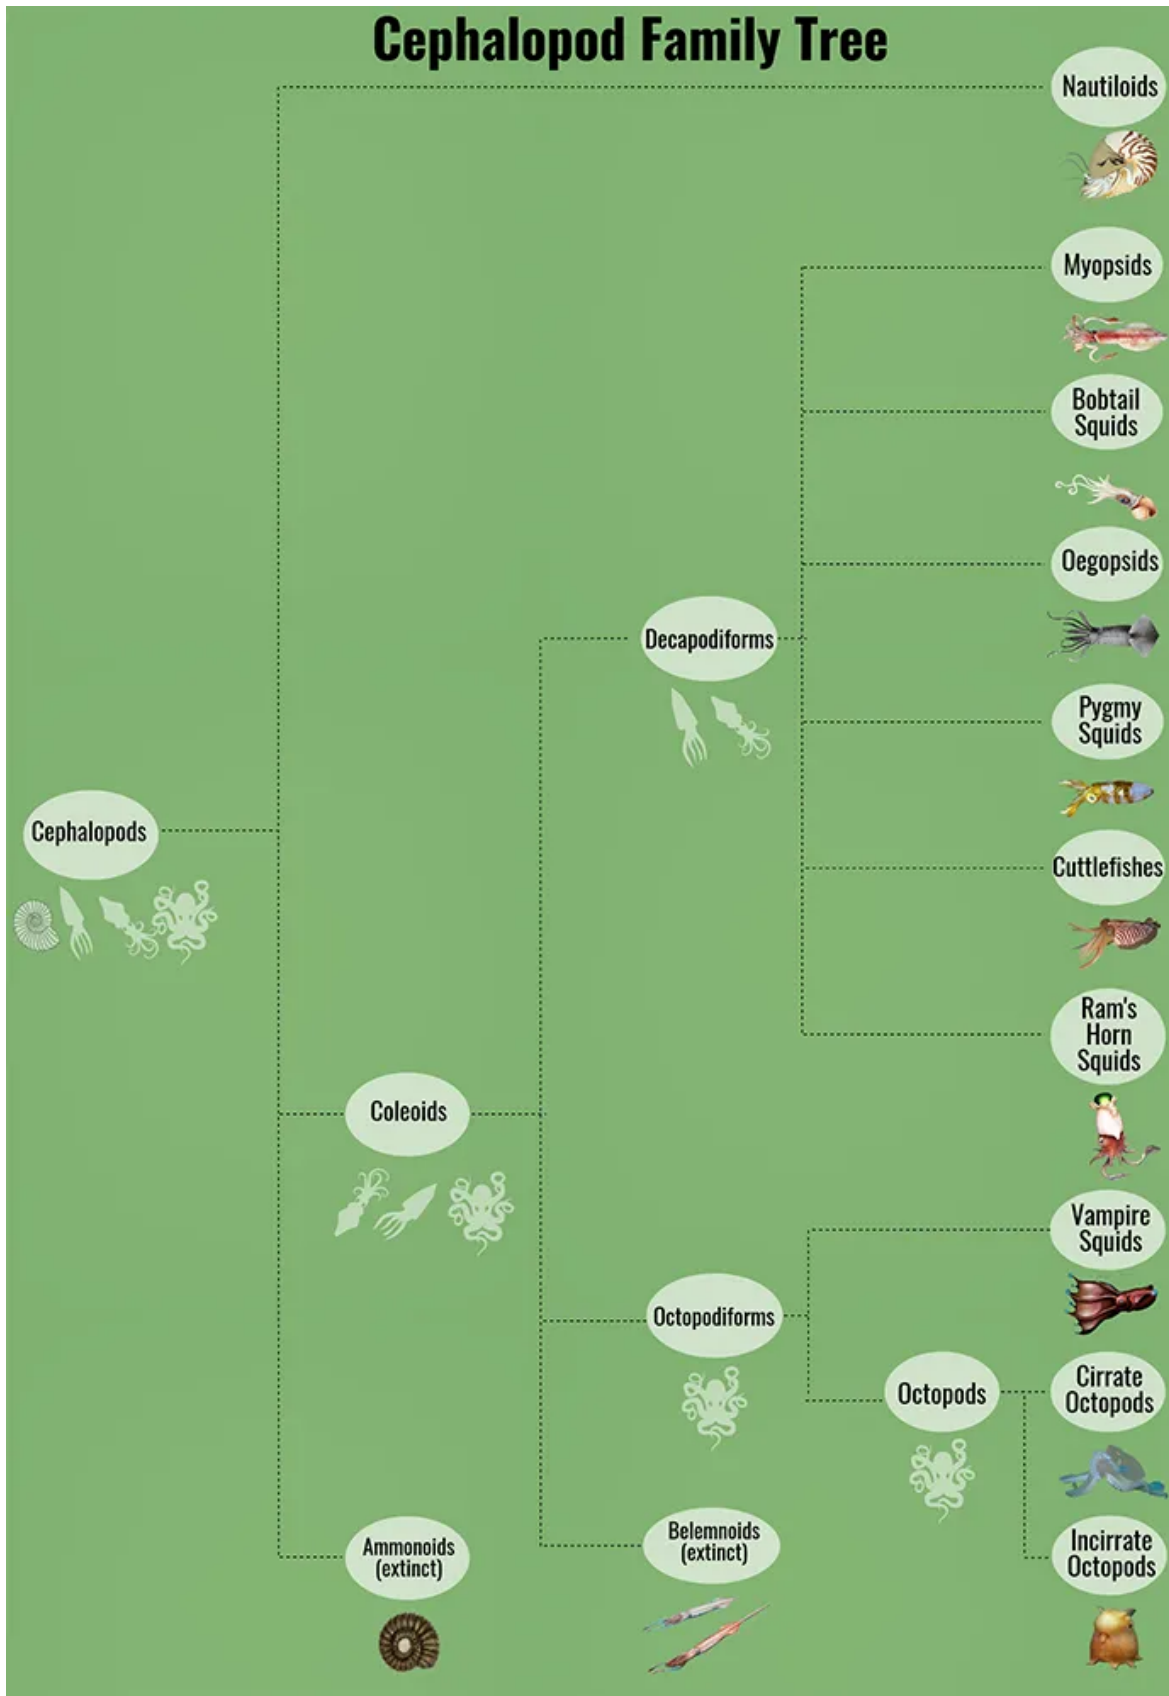

Recently, **California and Washington** have approved **bans on octopus farming**. **Hawaii** is considering similar action against raising **octopus, a member of Cephalopods**, demand for food.

What are Cephalopods?

- **About:** Cephalopods are a class of **ocean-dwelling intelligent invertebrates** that includes **cuttlefish, squid and octopus**.
 - Cephalopods are a broad class of **molluscs**. Mollusca are **soft-bodied invertebrates**, often enclosed **partly or fully** in a **calcium carbonate shell**.
 - Early cephalopods had **protective shells**, but many lost them, and evolved traits like **high intelligence, flexible arms, and camouflage**.
- **Diversity:** Cephalopods are a diverse class with **three superorders**:
 - **Octopodiforms** (octopuses and related species)
 - **Decapodiforms** (squid, cuttlefish, and related species)
 - **Nautiloids** (nautilus and related species)
- **Anatomy:** The term **cephalopod** means "**head foot**," referring to the connection between their head and arms.
 - Cephalopods have **two eyes and at least eight arms**. E.g., octopuses are eight-armed while **squids are ten-armed**.
 - **Nautilus** are the only cephalopods with an **external shell**.
- **Eyes and Vision:** Most cephalopods are likely **colorblind** and exhibit **visual camouflage**.
 - They can **open and close tiny sacs** just below their skin that contain coloured **pigments and reflectors**, revealing specific colours.
- **Movement:** Cephalopods mainly use **jet propulsion**, expelling water from their mantle cavity to propel themselves.
 - Octopuses **walk with their arms**, while squid and cuttlefish use **fins** for movement.
- **Circulatory System:** Cephalopods have **three hearts**: two pump deoxygenated blood, and one pumps oxygenated blood.
 - Their **blood is blue** due to **copper-based hemocyanin**, which is less efficient than iron-based **hemoglobin** but highly effective in **cold, low-oxygen environments**.
- **Brain:** Over half of the **neurons** in common octopus (*Octopus vulgaris*) are not in the brain at all, but distributed in "**mini-brains**," or **ganglia, in the arms**.
 - Most neurons in the **central brain focus on vision**, leaving less than a quarter for learning and memory.

Cephalopod Family Tree

UPSC Civil Services Examination Previous Year Question (PYQ)

Prelims

Q. With reference to the evolution of living organisms, which one of the following sequences is correct?(2009)

- (a) Octopus - Dolphin - Shark
- (b) Pangolin - Tortoise - Hawk
- (c) Salamander - Python - Kangaroo
- (d) Frog - Crab - Prawn

Ans: (c)
