

Landslide Dams in Uttarakhand

Why in News?

A recent study by <u>IIT Roorkee</u> identified <u>the Alaknanda River</u>, flowing through the Garhwal region, as the most vulnerable to landslide-induced natural dams. The study is titled 'Landslide Dam Studies in Uttarakhand, India: Past, Present, and Future' and published by Springer.

It highlights that the Alaknanda is followed by <u>the Mandakini</u>, <u>Dhauliganga</u>, and <u>Bhagirathi</u> rivers in terms of susceptibility to such dams.

Key Points

- Findings of the Study:
 - Uttarakhand's Terrain:
 - Uttarakhand's narrow valleys and gorges make it highly vulnerable to landslideinduced natural dams, which block rivers and create upstream lakes.
 - These blockages pose a significant risk of <u>landslide lake outburst floods</u>
 (<u>LLOFs</u>), which can have catastrophic consequences.
 - Most Affected Areas:
 - Chamoli, Rudraprayag and Uttarkashi, are the most affected by landslide dams.
 - The breach of **Gohna Tal in Chamoli** remains the region's most severe landslide dam incident, impacting areas downstream as far as Haridwar.
 - Historical Context of Landslide Dams:
 - Landslide dam formations in Uttarakhand trace back to the Last Glacial Maximum (LGM), between 29,000 and 19,000 years ago.
 - Significant events of landslide damming have been recorded since the 19th century, with the most notable being the breach of Gohna Lake in 1970, which had long-term impacts.
 - Current Trends and Concerns:
 - The study indicates that the peak month for landslide dam events is August, coinciding with monsoon rains.
 - <u>Climate change</u>, <u>deforestation</u>, <u>road construction</u>, <u>and <u>hydropower</u> <u>projects</u> have exacerbated the frequency of such events in recent decades.</u>
 - Risk Mitigation and Preparedness:
 - While there have been fewer major incidents since 2018, the study stresses the need for **preparedness to mitigate future risks.**
 - The instability of landslide dams, especially in narrow valleys, poses significant challenges for **disaster management**.
 - Key Triggers of Landslides:
 - Heavy rainfall and cloudbursts are identified as major triggers of landslides.
 - **<u>Debris slides</u>** are the most common type of landslide responsible for blocking rivers in Uttarakhand's hills.

Alaknanda River

- It is one of the headstreams of the Ganga.
- It rises at the confluence and feet of the Satopanth and Bhagirath glaciers in

Uttarakhand.

- It meets the Bhagirathi River at Devprayag after which it is called the Ganga.
- Its main tributaries are the Mandakini, Nandakini, and Pindar rivers.
- The Alaknanda system drains parts of Chamoli, Tehri, and Pauri districts
- The Hindu pilgrimage center of <u>Badrinath</u> and the natural spring Tapt Kund lie along the banks of the Alaknanda River.

Bhagirathi River

- It is a **turbulent Himalayan river** of Uttarakhand, and one of the two headstreams of the Ganges.
- The Bhagirathi **rises at the foot of** Gangotri Glacier, at Gaumukh, at an elevation of 3892m and fanning out into the 350 km wide Ganga delta, it finally empties into the Bay of Bengal.
- The Bhagirathi and Alaknanda join at Devprayag in Garhwal and are thereafter known as the Ganges.

Dhauliganga

- It originates from Vasudhara Tal, perhaps the largest glacial lake in Uttarakhand.
- Dhauliganga is one of the important tributaries of Alaknanda, the other being the Nandakini,
 Pindar, Mandakini and Bhagirathi.
- Dhauliganga is joined by the Rishiganga river at Raini.
