

## Card Tokenization in India

Source: BL

<u>Card tokenization</u> has become a significant technological advancement in India, enhancing security and customer convenience in <u>digital payments</u>.

- Over 91 crore tokens were issued by December 2024 and has enabled nearly 98%
  of e-commerce transactions to be processed without actual card data, reducing the risk
  of data breaches.
- Tokenization: It substitutes actual card details with a unique code, or "token," which acts as a secure identifier during transactions.
  - Types: Device tokenization (specific to each device) and Card-on-File tokenization (specific to each merchant).
  - **Security Benefits**: Tokens **prevent** merchants from storing **sensitive** card details, safeguarding customers' information in case of a security breach.
  - Future Expansion: Tokenization is expected to grow beyond e-commerce into contactless payments, recurring transactions, and potentially <u>UPI</u>-linked credit card payments.
  - Cybersecurity Regulations: In October 2022, RBI mandated that merchants and payment processors no longer store customer card data, relying entirely on tokenization.
