

Golden Tiger in Kaziranga National Park

[Source: TH](#)

Why in News?

Recently, a wildlife photographer captured a **rare golden tiger** in [Kaziranga National Park \(KNP\)](#).

What are the Key Facts About the Golden Tiger?

- **Golden tigers** (also known as golden tabby tigers) are a **colour form**, not a separate subspecies, like white and [black tigers](#).
 - They are exceptionally rare in the wild and even rarer in captivity.
- Golden tiger spotted in KNP are a **color variation of Bengal tigers** caused by a presence of recessive gene called "**wideband**".
 - The wideband gene reduces melanin production during the cycle of hair growth. Thus, the **agouti mutation (production of a protein that is usually expressed in the skin) is responsible for the blond or golden skin**, while the orange stripes appear due to the '**tabby**' mutation'.
 - The Tabby gene responsible for most tabby patterns (coat pattern) in domestic cats.

- Black and golden tigers basically exist as they **both possess a recessive gene** which is expressed due to the **absence of a dominant gene to suppress it**. When two individuals with dominant traits breed, recessive genes are masked, but **when two individuals with recessive genes breed, the recessive gene is expressed** and such is the case for these two tiger (Black and golden) mutants.

TIGER

Royal Bengal Tiger (*Panthera tigris*) is the National animal of India.
